**Measuring of elements in aqua regia digestion solutions with ICP  
– problems and solutions**

**problems:**

- aqua regia matrix (Cl-compounds)
- soil matrix (high Al, Fe, sometimes Ca, low heavy metal conc.)
- calibration standard matrix (standards with low or high conc. for all elements!)
- wavelength interferences between elements

**solutions ???**

effects of the soil matrix (high Al, Fe, sometimes Ca, low heavy metal conc.) to the ICP plasma:

High salt conc. => cooling of the plasma => worse atomisation for some elements, lower ionisation of alkaline elements

**effect: apparently higher Na, K conc. and lower P conc.**

**2 possible solutions:**

- **adaption of the calibration standards**
- **internal standards**

### Use of internal standard:

Good internal standards react on changings of the viscosity, the salt concentration and the plasma temperature the same way as the corrected elements in the plasma:

### Use of internal standard:

The problem is that different elements lines react sometimes different from the internal standard lines:

**=> For each used element line a adapted internal standard is needed!**
